Figure 1 consists of five panels. Panels A through D are histological sections of atherosclerotic plaques. Panel A shows a plaque at 0 days post-treatment. Panel B shows a plaque at 30 days post-treatment. Panel C shows a plaque at 60 days post-treatment. Panel D shows a plaque at 90 days post-treatment. A scale bar is present in the top right of panel A. Panel E is a line graph showing the percentage change in plaque size over 120 days for four groups: A (solid line, filled circles), B (dashed line, open squares), C (dotted line, open triangles), and D (dash-dot line, filled diamonds). The y-axis is labeled '% change in plaque size' and ranges from -60 to 60. The x-axis is labeled 'Time between images (days)' and ranges from -30 to 120. Group A shows a significant decrease in plaque size, reaching approximately -55% at 120 days. Group B shows a significant increase in plaque size, reaching approximately 55% at 120 days. Groups C and D show minimal change, with C reaching approximately 15% and D reaching approximately -35% at 120 days.

Time between images (days)	Group A (% change)	Group B (% change)	Group C (% change)	Group D (% change)
0	0	0	0	0
120	-55	55	15	-35
